This paper presents the Efficiency and capability of existing geo hazards related courses in present times. Geo hazards related courses are not being taught in many departments, colleges, institutions and universities of Khyber Pakhtunkhwa. If they exist in few faculties, even there the courses are discrete. There exists a lot of variation in the course content and its utility and the student response to them. Instructing staff mostly deals with the post hazards effects and solutions for the future disaster scenarios via different hazard models and patterns. It is concern that whether the existing courses are enough for the better understanding of the disaster and coping with them effectively. This research discusses different course module and their utility for the students as well as the institutions.
